

The climate scientists ignore the laws of physics!

The laws of physics were known 40 years ago. It is incomprehensible that it has been ignored for so long and that it is still being ignored.

It is fundamental that energy moves from hot to cold, not the other way around! No new energy is created in the atmosphere. The atmosphere insulates, i.e. delays the departure of energy. No changes have been observed in the atmosphere that would indicate that its insulating properties have changed.

Extreme weather occurrences are not a sign of climate change. They occur in given regions with varying strength year after year. This is how they are a characteristic of the region's climate.. They are included in the global avg. temperature which has a weak trend increase of approx. 0.02 degrees/year. The best you can call this is climate variations.

There are years between each time they are extra extreme!

The researchers who are allowed to come forward cannot possibly have a physics education. They have every reason to be careful with what measures they prescribe, they can quickly have the opposite effect than what is claimed. That is, heating and not a cooling (reduced heating)!
